

Nmap Network Scan Report

1. Objective

The purpose of this task is to perform a TCP SYN scan on the local network, identify active hosts, analyze open ports, research services running on those ports, find potential risks, and save the scan results.

2. Nmap TCP SYN Scan Command

```
nmap -sS 192.168.0.0/24
```

3. Scan Results Summary

Active hosts detected: 3

Host scanned: 192.168.0.104

Open Ports:

- 135/tcp msrpc
- 139/tcp netbios-ssn
- 445/tcp microsoft-ds
- 2869/tcp icslap

4. Research on Services Running on Open Ports

Port 135 – msrpc: Windows Remote Procedure Calls.

Port 139 – netbios-ssn: Windows file and printer sharing.

Port 445 – SMB: File sharing and network drives.

Port 2869 – icslap: UPnP device discovery.

5. Potential Security Risks

Port 135: Vulnerable to remote code execution.

Port 139: Can leak device information.

Port 445: Used in ransomware attacks (e.g., WannaCry).

Port 2869: May expose device details if misconfigured.

6. Saving Scan Results

Text: `nmap -sS 192.168.0.0/24 -oN scan_results.txt`

XML: `nmap -sS 192.168.0.0/24 -oX scan_results.xml`

HTML: `xsltproc scan_results.xml -o scan_results.html`

7. Conclusion

The Nmap scan identified open ports and services on the network. Some ports pose security risks if exposed publicly, particularly port 445.
